Alternatively, choose a bare bulb without housing if you already have experience with replacing bare bulbs and are willing to deal with the more challenging replacement process. If you do not want to compromise on projection quality and reliability, choose an original manufacturer lamp. If you prefer a cheaper option and projection quality and reliability are not your top priority, buy a generic lamp. A suitable compromise is the original bulb inside option. It provides the same projection quality as an original manufacturer lamp, yet for a better price. You can choose from 3 lamp options original, hybrid or generic. This option is recommended for its maximum reliability and easy replacement process. This is a very reliable solution and is cheaper than the original manufacturer option. We recommend it thank to its reliability and affordable price. It is a cheaper solution recommended for inhome use, where projection quality and reliability are not as crucial. Even though generic lamps are not necessarily of the same quality as original manufacturer lamps, their price is nevertheless very attractive. You can choose from two options of this bare lamp original or generic. This solution is cheaper than a lamp with housing, although it requires a certain amount of manual skills. This option is recommended for customers who already have some experience with bare bulb replacement. Keep in mind that replacing the bulb in the housing requires manual skills and tools. It is the cheapest option which we recommend for inhome use, where projection quality and reliability are not as crucial. Even though generic bulbs are not necessarily of the same quality as original manufacturer bulbs, their price nevertheless is very attractive. Please try again I used to have to put a heavy object on it to hold it down. Sorry, we failed to record your vote. Please try again My Acura Integra has rubber gaskets that seal the brake light housing to the metal frame of the car. Over time the compression fit of the seals loosens and water gets between and ultimately into the light housing. I removed the gasket and put this tape on both sides and reattached. Now in addition to the compression fit there is essentially glue holding it in place. I also used a piece to reattach the sole of a sneaker. Very versatile stuff. Great uses beyond carpets. As for carpet use, this tape is rather thin. So if you have an irregular surface to adhere its not going to work well. I dont know if there are thicker tapes available for outdoor use. I know for indoor use there are. Sorry, we failed to record your vote. Please try again We live in Japan military and it has held up through two typhoons weak ones and a lot of run of the mill wind and rain. So far so good a few reinforcements were needed but I was not expecting such great results. I will edit either way when we get a real typhoon. Sorry, we failed to record your vote. Please try again As long as you have a lot of surface area this stuff holds like glue. I have to use acetone to get it off! Sorry, we failed to record your vote. Please try again. A millimeter is abbreviated by mm and a micrometer by the Greek letter mu 12th letter of Greek alphabet followed by an m The slide was stained with a drop of yellowishbrown grams iodine. Right Highly magnified view of a cell from the meristematic root tip of an onion showing enlarged nucleus containing 16 chromosomes. The cell is in prophase of mitosis, with distinct chromosomes chromosome doublets and a disintegrating nuclear membrane. This is like measuring the length of your finger nails with a yard stick. The values in parentheses are more precise. If you know the diameter of the fov at one magnification, you can determine the diameter of fov at another magnification with the following formula The diameter of field of view fov is 0.184 millimeters 184 micrometers. This corresponds to a 0.46 millimeter fov at 400 x magnification. It was placed in a new family of viruses, the Mimiviridae. In fact it is larger than the bacterium causing gonorrhea. Until 1960, the only known examples of viruses with helical symmetry were those of plant viruses. The best studied example being the tobacco mosaic virus. The capsid denotes the protein shell that encloses the nucleic acid. The length of the helical viral nucleocapsid is determined by the length of the nucleic acid. Although most viruses are not visible under an ordinary light microscope, mimivirus appears like a minute spheroid object under a compound microscope using an oil immersion objective 1000x magnification. An icosahedron has 20 identical equilateral triangles facets, each subdivided into more equilateral triangular facets. There are electron micrographs of mimivirus available on the Internet. Simply do a search for mimivirus using one of the excellent search engines, such as google.com. The bases make up 1,260 genes, which makes it as complex as some bacteria. Most viruses use either DNA or RNA to carry their genetic information, but mimivirus has both of these nucleic acids.

In addition, mimivirus can make about 150 of its own proteins, and can even repair its own DNA if it gets damaged. Normal viruses are not capable of protein synthesis or DNA repair on their own, they must rely on the organelles of their host cells for these activities. Whether mimivirus should be placed in an existing domain superkingdom, or in its own domain, remains to be seen. Eukaryotic cells are characterized by the presence of membranebound organelles, including chloroplasts, mitochondria and nuclei. The origin of a complex cell has intrigued scientists for decades, and has been a strongly debated topic between evolutionists and creationists. According to the endosymbiont hypothesis, bacteria may be the progenitors of cellular organelles such as chloroplasts and mitochondria. A primitive nucleus protonucleus may have evolved from an intracellular virus; however, one weakness of this hypothesis is that viruses generally lack some of the key genes found in eukaryotes. The complex genome of mimivirus includes these genes, lending support to the evolution of a protonucleus from a virus. They are much smaller and much less complex than cells. They are macromolecular units composed of DNA or RNA surrounded by an outer protein shell. They have no membranebound organelles, no ribosomes organelle of protein synthesis, no cytoplasm living contents of a cell, and no source of energy production of their own. They do not exhibit autopoiesis. i.e. they do not have the selfmaintenance metabolic reactions of living systems. Viruses lack cellular respiration, ATP production, gas exchange, etc. However, they do reproduce, but at the expense of the host cell. Like obligate parasites, they are only capable of reproduction within living cells. In a sense, viruses hijack the host cell and force it to produce more viruses through DNA replication and protein synthesis. Outside of their host cells, viruses can survive as minute macromolecular particles.

Viruses may attack animals and plants. Infectious human viruses can be dispersed though the air airborne viruses or body fluids HIV virus. Epidemic viruses such as HIV that are passed from person to person via sexual conjugation are remarkably similar to computer viruses. Unfortunately in humans there is no resident antivirus program to alert you of a potential infection, or to quickly scan your body and delete the invader once it has entered your system. Humans must rely on their amazing antibody and cellmediated immune responses, some of the most complex and remarkable achievements in the evolution of living systems. Computer Viruses See The WAYNES WORD Virus

Article Coronaviruses cause diseases in mammals and birds. In humans, the viruses cause respiratory infections, including the common cold, which are typically mild, though rarer forms such as SARS, MERS and COVID19 can be lethal. Symptoms vary in other species in chickens, they cause an upper respiratory disease, while in cows and pigs coronaviruses cause diarrhea. There are no vaccines or antiviral drugs to prevent or treat human coronavirus infections. They are enveloped viruses with a singlestranded RNA genome and a nucleocapsid of helical symmetry. In this illustration of a coronavirus virion, the clubshaped viral spike peplomers, coloured red, create the look of a corona surrounding the virion, when viewed with electron microscope. For health care workers in contact with coronavirus patients, the CDC recommends a more specialized type of face mask called N95one that is individually fitted to a persons face to create a seal and that filters out 95 percent of particles that at least 0.3 microns in diameter. Spores of this size can easily escape from a folded closed paper envelope that is not airtight. Anthrax *Bacillus anthracis* is one of the microorganisms used in biological warfare because strains have been developed that are extremely infectious through the skin and through inhalation.

In addition, it forms highly resistant spores that can survive for long periods. Approximately one teaspoon or two grams of anthrax may contain up to 20 billion spores. With an average infection rate of 10,000 spores per person, this is theoretically enough spores to infect 2 million people with inhalation anthrax. The minute paired dots red arrow are diplococcus gonorrhea bacteria *Neisseria gonorrhoeae*. Each dot coccus bacterium is only about 0.5 micrometers in diameter. Some of the neutrophils have ingested the bacteria through phagocytosis. Right A culture of rodshaped anthrax bacteria *Bacillus anthracis*. These 46 chromosomes comprise about 6 feet of DNA 2 meters. This amount of DNA was previously thought to contain about 100,000 functional genes, but that number has now been reduced to about 30,000 genes one percent of the total DNA in the nucleus. In terms of information storage, the genetic information in a cell is roughly equivalent to 500 printed volumes of Encyclopedia Britannica 12 characters per inch. In the middle piece, mitochondria are packed around the microtubules and provide the energy for movement. The journey of a single sperm in the female reproductive tract is analogous to a salmon swimming ten miles upstream to spawn. The head contains a nucleus covered by an outer cap called the acrosome which stores enzymes needed to penetrate the cellular and glycoprotein layers surrounding the egg. Surgical sterilization of a man is called a vasectomy. Each of the two vas deferentia sperm ducts from the left and right testicles are cut and tied in two places, and the portion between the ties removed. Residual sperm may be present in the vas deferentia for up to a month following a vasectomy; therefore, periodic microscopic examinations are recommended until sperm are no longer visible in semen samplers. The illustration insert shows the acrosome, head and middle piece of a human spermatozoan.

The inside is filled with a dark mass of spores intermingled with threadlike hyphae capillitium. The closeup view of spores right was taken at 1,000x. This can easily According to David Arora Mushrooms Demystified, 1986, a large puffball may contain 7 trillion spores. Lined up single If each spore produced a The main body of a lichen is composed of fungal tissue usually class Ascomycota with photosynthetic algal cells usually division Chlorophyta embedded within this fungal mass mycelium. The spores are produced by the fungal component or mycobiont, usually in a cupshaped body called an ascocarp. Lichen spores can be 12 micrometers in *Acarospora chlorophana*, or up to 40 micrometers long in *Diploschistes scruposus* left. The size, color and shape of spores are useful traits in separating different species of lichens. Spores up to 40 micrometers or longer are considered large. The hair width is 0.070 mm or 70 micrometers. With the unaided eye the single hair shaft is visible when placed on a sheet of white paper. Each hair is approximately 70 micrometers in width diameter. With 20/20 vision you should be able to differentiate between the two hairs at the proper focal distance. B. When placed closer to each other about 15 micrometers apart, the two hairs appear to blend together and cannot be differentiated with the naked eye. A hand lens or magnifying glass is necessary to differentiate between the two hairs. Although the hairs can be

seen on a white background, they cannot be resolved if they are placed close together. The minimum resolution for a computer monitor is 72 dots per square inch dpi, otherwise the image becomes pixelated. Printed photos are also composed of dot patterns. Above 150 dpi, the dots generally blend together and cannot be resolved. Under a hand lens or microscope the dots can easily be observed. The fourmicron space between the outer rings of the pattern that is resolved by the fovea is approximately equal to two cone widths.

They are dispersed into the air like minute dust particles or singlecelled spores, eventually coming to rest in the upper canopy of rain forest trees. Some of the largest trees are over 300 feet tall, rivaling in size the California coast redwood *Sequoia sempervirens*. It has a volume of about one nonillion  $1 \times 10^{30}$  cubic millimeters. This astonishing volume is roughly equivalent to the volume of one nonillion wolffia plants packed together after 4 months of asexual budding! The earth is about  $10^{20}$  power larger than a wolffia plant, or  $10^{40}$  power larger than the water molecule. Tardigrades are minute animals often found on lichens and mosses. According to Desch and Nutting *The Journal of Parasitology* 58 1 169177, 1972, there are two species of follicle mites on humans. *Demodex folliculorum* measures 0.3 to 0.4 mm in length and typically occupies hair follicles. *Demodex brevis* is about half that size 0.15 to 0.2 mm and typically lives in sebaceous glands adjacent to hair follicles. The latter mite is only about the size of a unicellular *Paramecium* and appears to be the species I found in my nose. Illustration left modified from T. Ross and photographs of dorsal side of *D. brevis* by W.P. Armstrong. Magnification 400x. At 100 feet in length and weighing almost 200 tons, it is larger than the largest herbivorous dinosaurs. Fossil evidence from Patagonia indicates that 70 ton titanosaurs were the largest animals to have ever walked on land. A pollen tube must travel down each silk style in order to fertilize each grain. The yolk is essentially the enlarged ovum or egg cell. As this cell undergoes mitosis, the daughter cells become smaller and smaller until they are invisible to the naked eye. Egg-laying oviparous birds have large yolks rich in proteins and lipids to sustain the embryo. The developing chick obtains air through minute pores in the calcium carbonate egg shell. Pores in the shell are plugged by collagen, but are still permeable to air.
